

PRESSES FOR RAT-BAIT DOSES

EURAGGLO offers a briquetting, compaction and granulation process based on the technology of roller presses and compactors.

This process allows the briquetting of wax-based rat bait into separate doses. The technology enables to produce briquettes under ovoid form, square pillow shape and granules.

The agglomeration process can be influenced by the material mix characteristics, its moisture rate and its feed size range.

EURAGGLO can guide you to select optimum equipment in this field.

Proposed Services

- Audit of existing units.
- Applied R&D in pilot plant.
- Engineering process,
- Manufacturing of compactors and granulators.
- Integration of complementary equipments (dryer, crusher, mixer...).
- Maintenance and associated on-site services.

PROCESS

The process consists in briquetting or compacting/granulating under pressure rat bait into briquettes or granules. Generally, rat bait is agglomerated after the mixing step involving the different components. A force feeder feeds the mix between two rotating parallel rollers turning in opposite directions.

This process allows the formation of briquettes or flakes. Depending on the need, the flakes can be crushed into granules and screened to the required final size ranges (2-5mm, 3-6mm...).

The mix quality determines the compression roller speed and the pressure level. The final dose size can be between 4 and 20g or higher.

ADVANTAGES

- A large choice of briquetting press capacities and design (different briquette shapes, different feeding systems...).
- A proven process : many references of such plants in operation worldwide.
- The capacity to test different mixes in our pilot plant.
